

# *AVS Meeting January 25, 2012*

## **Vacuum Chambers: The Atmosphere of Excellence**

# Some Facts about GNB

# Some Facts

- Founded in 1968 by Gary N. Burnett
- Located in Elk Grove, CA (South of Sacramento)
- 60 Employees (7 Design Engineers)
- 62,500 Sq Ft. Facility
- Focused on Vacuum Chambers and Valves
- ISO 2000 – 9001 Certified

# Focus: Large Manufacturing

# Vacuum Valves

4" to over 100"

# Vacuum Chambers

**9 ft Diameter x 16 ft Long**

# Vacuum Chambers Are Exciting

# How Could a Metal Box be Exciting?

- New tools make it fun to design chambers
- Welding is faster and tighter than ever
- Unique advantages of combining or separating parts
- UHV is bigger and cheaper
- Fit and finish for any budget

# Revolutionary Design Tools

# Finite Element Analysis

- FEA tools make analyzing complex shapes possible
  - Lighter weight chambers
  - Increased rigidity
  - Reduced costs
  - Heat transfer, deflection and stress are primary calculations

# Stress Analysis Example

Complex Shapes can be Difficult to Analyze

Given: 304 sst

99.63" OD x 206.25" L

Wall thickness 3/8"

Operating temp 200F

# Minimizing Deflection is the Key to Great Vacuum Chambers

Model name: ANALYSIS MODEL

Study name: Study 1

Plot type: Static displacement Displacement1 (-Res disp-)

Deformation scale: 69.478

Figure 8: Displacement, All loads, Unclipped, Isometric View

## Secondly, We Analyze Stress at Elevated Temperatures

Model name: ANALYSIS MODEL

Study name: Study 1

Plot type: Static nodal stress Stress 1 (-vonMises-)

Deformation scale: 69.478

Figure 4: Stress, All loads, Unclipped, Bottom View

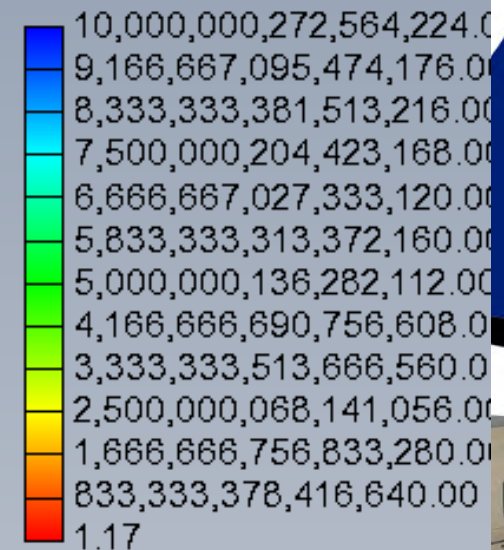

# Factor of Safety was 1.17

Model name: ANALYSIS MODEL  
Study name: Study 1  
Plot type: Factor of Safety Factor of Safety1 (-FOS-)  
Criterion : Automatic  
Factor of safety distribution: Min FOS = 1.2

Figure 7: Factor of Safety,  
All loads, Unclipped, Front  
View

FOS

# Risks and Benefits of FEA Tools

## Benefits

- Ability to analyze complex shapes
- Fast process
- Temperature is included

## Risks

- Incorrect restraints and assumptions
- Over confidence in numbers by inexperienced users
- Fabrications are not as exact as models

# Waterjet Cutting

# Waterjet

- 5-axis Waterjet can be used to prepare edges for welding
- No heat involved, there will be no thermal stress in the material and the cut will be oxide free

# CAM Systems

- In conjunction with waterjet cutting have revolutionized chamber manufacturing
  - No machining on most parts
  - 5-axis cutting
- Reduced paper

# 5-axis Waterjet Cutting Makes Port Fitting Simple

# Welding Layouts are Done by CNC Programming

# Measurement Goes to the Work Piece

Inspection Arms

Laser Scanners

# With Inspection at the Part During Welding no Post Weld Machining is Required

# Welding

# Welding Processes for Vacuum Chambers

- TIG (Tungsten Inert Gas)
  - Standard process for critical vacuum welds
- MIG (Metal Inert Gas)
  - Standard process for structural welds
- Dual Shield MIG

# Welding Processes for Vacuum Chambers

- Electron Beam Welding
  - Deep penetration
  - Small heat impact zone
- Friction Stir Welding
  - For Aluminum

# Stress Relieving

- The benefits of stress relieving after/ during welding are:
  - Less stress in material
  - Less deformations of chamber during and following machining operations
  - Better quality of welding seam if vibratory stress relieving is done during welding

# Vibratory Stress Relieving

- Alternative to thermal stress relieving for very large structures
- Vibrations 60% to 100% of resonance frequency are implemented into work piece

# Integration of Components Into a Vacuum Chamber

# Benefits of Integration

- The traditional layout of a system has components flanged onto a chamber.
- The benefit is higher flexibility.
- Integrating valves, baffles and other components into a chamber can save costs and most of the time will reduce the size of the system.

# Chamber with Gate Valves

# Chamber with Curved Gate

- GNB Engineered Chamber measuring 1.5m in diameter.
- Includes a 170° custom valve that seals with differential pressure in either direction.

# Load Lock Module

- Door, LL chamber and transfer valves can be combined into one compact package.

**UHV is Bigger &  
Less Expensive**

# Typical UHV Seals

- Wire seal flanges
- Conflat flanges
- Garlock Helicoflex
- Ferrofluidic seal

# Two Challenges

- Larger flanges
- Reduced costs

# 4 Meter Long All-metal Seal

# Surface Preparation and Cleaning

# Correct Material Selection

**Approximate outgassing rates to use for  
choosing vacuum materials or  
calculating gas loads**

*(All rates are for 1 hour of pumping)*

| Vacuum Material      | Outgassing Rate<br>(torr liter/sec/cm <sup>2</sup> ) |
|----------------------|--|
| Stainless Steel      | $6 \times 10^{-9}$                                   |
| Aluminum             | $7 \times 10^{-9}$                                   |
| Mild Steel           | $5 \times 10^{-6}$                                   |
| Brass                | $4 \times 10^{-6}$                                   |
| High Density Ceramic | $3 \times 10^{-9}$                                   |
| Pyrex                | $8 \times 10^{-9}$                                   |

| Vacuum Material | Outgassing Rate<br>(torr liter/sec/linear cm) |
|-----------------|---|
| Viton (Unbaked) | $8 \times 10^{-7}$                            |
| Viton (Baked)   | $4 \times 10^{-8}$                            |

If some elements are not permitted in a chamber, keep them away!

- Mild Steel
  - No mild steel fixtures, carbide cutting tools
- Tungsten
  - No TIG welding

# Cleaning Processes

- Depends on desired vacuum level and process
  - High pressure wash
  - Wash with DI water
  - Alcohol wipe down
  - Ultrasonic chemical clean
  - Passivation and electro-polishing
  - Bake out

# Passivation

- According to ASTM A380, passivation is "the removal of exogenous iron or iron compounds from the surface of stainless steel"
- Will avoid corrosion especially in 300 series stainless
- Typically done with acids followed by a water (or DI water) rinse

# Electro-polishing

- Deburrs
- Smooths
- Brightens
- Passivates
- Redefines oxide layer
- Removes surface contaminants

# Cost Effective Surface Finishes

# 5 Main Reasons for Selecting a Surface Finish

- Aesthetics
- Gas load
- Fit up
- Elimination of trapped volumes
- Ease of cleaning

**The cost can be large and  
many companies over specify!**

# Waterjet Cutting has Dramatically Changed Chamber Manufacturing

**Waterjet edges are specified by “Q” codes.  
The better the finish, the slower the cut.**

# 15 Common Surface Finishes

- Number 0 finish is hot rolled annealed (also known as mill-scale)
- Number 1 finish is hot rolled
- Number 2D finish is cold rolled
- Number 2B finish, cold rolled bright finish
- Number 2BA is bright annealed finish, nearly a mirror
- Number 3 grained, sanded in a uniform direction with 80-100 grit
- Number 4 grained, sanded in a uniform direction with 150 grit
- Number 6 finish is plate sanded with a rotating abrasive cloth; “Satin Blend” is an example
- Number 7 finish is buffed, highly reflective, some fine scratches
- Number 8 finish is a true blemish-free mirror finish
- Bead blasted
- Blanchard ground
- Machined all over
- Electro-polished
- A lapped finish

# Surface Roughness for Typical Chamber Processes

| Process        | Roughness Height Ra ( $\mu$ inch)  |      |     |     |     |    |    |    |   |   |
|----------------|------------------------------------|------|-----|-----|-----|----|----|----|---|---|
|                | 2000                               | 1000 | 500 | 250 | 125 | 63 | 32 | 16 | 8 | 4 |
| Flame Cutting  | -----XXXX-----                     |      |     |     |     |    |    |    |   |   |
| Waterjet       | -----XXXX-----                     |      |     |     |     |    |    |    |   |   |
| Sawing         | -----XXXXXX-----                   |      |     |     |     |    |    |    |   |   |
| EDM            | -----XXXXXXXXXXXX-----             |      |     |     |     |    |    |    |   |   |
| Milling        | -----XXXXX-----                    |      |     |     |     |    |    |    |   |   |
| Turning        | -----XXXXX-----                    |      |     |     |     |    |    |    |   |   |
| Laser          | -----XXXXXXXXXXXX-----             |      |     |     |     |    |    |    |   |   |
| Grinding       | -----XXXXXXXXXXXXXXXXXXXXXXXX----- |      |     |     |     |    |    |    |   |   |
| #4 Grained     | -----XXX-----                      |      |     |     |     |    |    |    |   |   |
| Electro-Polish | -----XXXXXXXX-----                 |      |     |     |     |    |    |    |   |   |
| Lapping        | -----XXXXXXXXXXXX-----             |      |     |     |     |    |    |    |   |   |

# To Eliminate the Conversion Confusion

| Ra (μ inch) | RMS (μ inch) | Ra (μ meter) | RMS (μ meter) | Grit Finish |
|-------------|--------------|--------------|---------------|-------------|
| 4           | 4.5          | 0.10         | 0.11          | Mirror      |
| 8           | 9.0          | 0.20         | 0.23          | 400         |
| 16          | 18           | 0.41         | 0.46          | 240         |
| 32          | 36           | 0.81         | 0.91          | 180         |
| 63          | 71           | 1.60         | 1.80          | 120         |
| 125         | 141          | 3.18         | 3.57          | 36          |
| 250         | 281          | 6.35         | 7.14          | NA          |
| 500         | 560          | 12.7         | 14.3          | NA          |
| 1000        | 1125         | 25.4         | 28.6          | NA          |
| 2000        | 2250         | 50.8         | 57.2          | NA          |

# Misconceptions

- Shiny surfaces are always better
  - Electro-polishing and graining, particularly, introduces contaminants into the metal.
- Electro-polishing is required for UHV
  - The greatest reduction in gas load occurs between a mill-scale and brushed mill-scale finish. It is difficult to find a difference in gas load between a #4 grained finish and an electro-polished finish.

# Thank You!
